

## Maintenance of Anodised Aluminium Frames

Maintenance of Anodised Aluminium Frames is limited to simple cleaning.

Frequency is determined by the requirements to each component's appearance and preparation.

Cleaning to be performed at least every 6 months. Frames, which are located in the vicinity of heavily contamination sources such as in industrial areas and along coastlines, shall be cleaned at least every 3 months.

Window frames and other components at ground level shall be cleaned more often; we recommend that cleaning of the window frames is performed together with the regular window cleaning.

Cleaning of Anodised Aluminium Frames is performed with water with an admixture of weak cleaning detergents suitable for anodised aluminium. Cleaning is to be performed with a soft brush or sponge with sufficient detergent. Make sure to rinse thoroughly with clean water as most detergents contain rinse aid. Excess water is removed with a rubber scraper or wash-leather.

The use of detergents containing abrasives or solvents will damage the surface.

Hard brushing or scrubbing will damage the Anodised surface and should be avoided.
